Postsecondary Student Aid Study

#### ABSTRACT

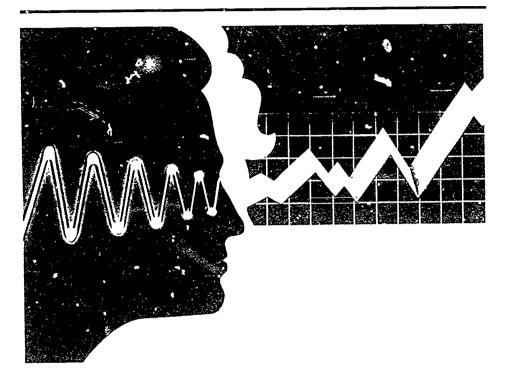

Using data from the 1986-87 National Postsecondary Student Aid Study (NPSAS), this statistical report profiles undergraduate students enrolled in postsecondary institutions in the United States. NPSAS data were supplemented with data from other sources, particularly, the Integrated Postsecondary Education Data System and High School and Beyond Study. In the fall of 1987, 12.4 million students were enrolled as undergraduates in American portsecondary institutions (7.6 million on a fu. '-time basis and 4.8 mi.lion on a part-time basis). Just over on -hall of these students were enrolled in 4-year institutions. Areas addressed in this statistical report include: (1) overall undergraduate enrollments; (2) demographic and socioeconomic characteristics; (3) academic preparation; (4) enrollment characteristics; (5) sources of financial support; and (6) educational objectives and college choice. Demographic and socioeconomic categories covered include: sex, race/ethnicity; age; family background; citizenship and veteran status; income; and father's educational attainment and occupational status. Academic preparation data include: information on high school graduation; high school concentrations; and Scholustic Aptitude Test and American College Test scores. Enrollment characteristics include: types of institutions attended; attendance status; housing arrangements; fields of study; and remedial education status. Dependency status and sources of support are also provided in the area of student aid. Twenty-two graphs and 26 data tables are provided. A glossary, technical notes, a discussion of the study methodology, and 28 supplemental tables are appended. (TJH)

## Highlights

This report profiles undergraduate students enrolled in postsecondary institutions. It relies primarily on data from the 1986-87 National Postsecondary Student Aid Study (NPSAS). This information is supplemented with data from other sources, particularly the Integrated Postsecondary Education Data System (IPEDS) and High School and Beyond (HS&B). Some of the major highlights are as follows:

- In the fall of 1987, 12.4 million students were enrolled as undergraduates in American postsecondary institutions, 7.6 million on a full-time basis and 4.8 million on a part-time basis. Just over one-half were enrolled in 4-year institutions.
- Of the fall 1986 undergraduates, 45 percent were male and 55 percent were female. The majority (60 percent) were in the traditional college-age category of 23 years old or younger, but 23 percent were 30 years old or older.
- Overall, a little more than three-fourths of the students were white, but there was considerable variation by type of institution. At 4-year institutions granting doctoral degrees, 82 percent were white; at 2-year institutions, 75 percent were white; and at less-than-2-year institutions, 60 percent were white.
- Approximately one-half of the fall 1986 undergraduates reported coming from families with annual incomes over \$30,000, and almost one-fourth came from families with annual incomes of \$50,000 or more.
- About one-half of the undergraduates had fathers with only a high school diploma or less. One-fourth had fathers with vocational or associate degrees, and one-fourth had fathers with bachelor's or advanced degrees.
- The vast majority of fall 1986 undergraduates (91 percent) received a high school diploma before entering a postsecondary institution. At less-than-2-year institutions, however only 70 percent received a regular high school diploma.
- The average verbal Scholastic Aptitude Test score for college-bound high school seniors was 430 in 1986-87, and the average math score was 476. Scores declined through the late 1960s and 1970s, but have increased slightly since 1980-81.
- In fall 1986, 77 percent of all undergraduates attended public institutions. Another 18 percent attended private, nonprofit institutions, and five percent attended private, forprofit institutions. Those attending public institutions were roughly equally divided between 4-year and less-than-4-year schools.
- Choice of institution type varied with race/ethnicity, age, income, and parents' education. Whites, younger students, students from high income families, and students with well-educated parents were the most likely to attend private, nonprofit, institutions.
- In fall 1986, the majority of undergraduates (62 percent) were enrolled full-time. In 4-year and less-than-2-year institutions, 75 percent or more were enrolled full-time. In 2-year institutions, on the other hand, only 39 percent were enrolled full-time.

iii

- Fifty percent of the fall 1986 undergraduates lived on their own, off-campus. Another 30 percent lived with their parents, and the remaining 20 percent lived in school-owned housing. In 4-year institutions, about one-third lived in school-owned housing, compared to only 3 percent in 2-year institutions and 1 percent in less-than-2-year institutions.
- Business/marketing was the most commonly reported field of study, with 29 percent of all students in this category.
- Eighteen percent of all undergraduates took some remedial education the first year they were enrolled.
- Sixty-three percent of all undergraduates were financially dependent on their parents, although the majority received some kind of financial aid or otherwise contirbuted to the cost of their education. Among those 23 years old or younger, 90 percent were financially dependent.
- Approximately three-fourths of all undergraduates contributed towards financing their own education or received financial support from their spouses. Approximately one-half of all students received some kind of financial aid—federal, state, institutional, or other.
- Fifty-nine percent of the fall 1986 undergraduates worked while they were in school. They worked an average of 23 hours per week if they were enrolled full-time and an average of 36 hours per week if they were enrolled part-time.
- Fifty-three percent of the fall 1986 undergraduates were working toward a bachelor's degree, 22 percent toward an associate degree, and 9 percent towards certificates. Six percent were seeking no formal award, and 3 percent were undecided.

#### Foreword

Undergraduate students in postsecondary institutions represent an important pool of human resources in this country. Educators and policymakers as well as the general public have been concurred about the size and composition of this pool. They frequently have raised such questions as: Who enters postsecondary education institutions? What are their social and economic backgrounds? What are their educational experiences? Unfortunately, answers to these questions are not readily available from one comprehensive source.

To fill this information gap, this report attempts to profile undergraduate students embled in American postsecondary institutions. It presents a collection of statistics and indicators of student background, characteristics, educational experience, and aspiration.

The report relies primarily on data from the 1986-87 National Postsecondary Student Aid Study (NPSAS). However, some data from the Integrated Postsecondary Education Data System (IPEDS), the High School and Beyond Study (HS&B), and other sources are included as well. Data files are available for those researchers who want to pursue their own analyses.

We hope that anyone with an interest in postsecondary education will find this report informative and useful. To assure that future editions of the *Profile of Undergraduates* will have even greater value for the postsecondary education community, we welcome ecommendations for improving the format, content, or analysis.

Samuel S. Peng Acting Associate Commissioner Postsecondary Education Statistics Division C. Dennis Carroll, Chief Longitudinal Studies Branch

# Acknowledgments

The authors wish to thank all those who contributed to the production of this report. Among MPR Associates staff, first and foremost was Eva Eagle, who provided overall direction and support from the initial design stages through final production. Also invaluable was the assistance of Ellen Liebman, who built the analysis files and produced the tables that served as the basis for this report. Dean Harde performed a number of critical tasks, including downloading data from a mainframe computer, performing tests of statistical significance, and formatting all of the tables included in the report.

We would also like to acknowledge the careful reading of this report by Roslyn A. Korb and a panel of reviewers: Sue Ahmed and Nabeel Alsalam of the National Center for Education Statistics; David Bergeron, Office of Postsecondary Education; Laurent Ross, American Council of Education; Meredith Ludwig, American Association of State Colleges and Universities; and David Goodwin, Office of Planning, Budgeting, and Evaluation.

Finally, we would also like to thank Carl M. Schmitt of the Longitudinal Studies Branch, who worked closely with us on this project.

#### CHAPTER I

#### INTRODUCTION

#### Background

American postsecondary education has become a large, diverse enterprise. In the last few years, more than 11 million undergraduates have enrolled in postsecondary institutions that range from schools offering vocational training programs of only a few months duration to 4-year universities offering doctoral degrees. The educational goals of students altending these institutions have also been diverse. Some students have enrolled to obtain a bachelor's degree, others have enrolled to obtain an associate degree, a certificate or a diploma, and still others have attended without seeking a formal award.

Because postsecondary students represent an important pool of human resources in this country, many programs have been established to enlarge and enhance this pool. To broaden the pool, federal, state, and institutional programs have provided students with a substantial mount of financial aid, and many institutions have made serious efforts to recruit students from groups that traditionally have been underrepresented in postsecondary education. To help undergraduates succeed once enrolled, many institutions have developed remedial programs and provided an extensive array of support services.

As educators and policymakers have become increasingly concerned about the size and composition of the undergraduate population, they have raised a number of interesting questions. Who enters postsecondary education institutions? What are their social and economic backgrounds? What were their high school educational experiences? What types of institutions do these students attend? What level of education do they ultimately plan to achieve? How do their backgrounds affect the educational choices they make?

Answers to such questions can help education program planners to identify specific areas that need improvement and segments of the undergraduate population that require special assistance. Unfortunately, the needed information is not yet readily available from one comprehensive source. Except for counts of students in various types of institutions and the basic distribution of students by sex, race, and full- and part-time status (collected on an annual basis through the Digest of Education Statistics), information about student demographics, family income, parental education, student aspiration and other educational experiences are generally scarce. At best, this information is reported sporadically in special studies.

## Purpose of this Report

The primary purpose of this report is to fill this information gap by synthesizing as much data as possible about student background and characteristics from various existing data sources. The report relies primarily on the National Postsecondary Student Aid Study (NPSAS). To supplement this information, some data from the Integrated Postsecondary Education Data System (IPEDS), the High School and Beyond Study (HS&B), and other sources are included as well.

The 1986-87 NPSAS, designed to answer fundamental questions about financial aid, included a national sample of students who enrolled in Fall 1986 at all academic levels and at all types of institutions. NCES has recently published a report on undergraduate financing of

1

postsecondary education that examines in detail education expenses, sources and types of aid, federal aid programs, composition of student aid awards, and sources of financial support to undergraduates. Because the NPSAS data base contains a wealth of information on students' socioeconomic characteristics and on their academic backgrounds, programs, and objectives, it can also be used to present a comprehensive picture of American undergraduates today—one that goes beyond how students financed their education.

Because the NPSAS data were collected in the fall, they do not represent all students who enrolled in a postsecondary institution during the 1986-87 school year. Students who did not enroll until after the fall term or who enrolled in short-term programs not in session at the time of the data collection are not represented in the sample. As a result, there are limitations in using the NPSAS data to estimate total numbers of students enrolled. However, estimates of percentages of students with various characteristics are accurate to the extent that students enrolled in the fall and at other times have similar characteristics.

Data from the High School and Beyond Study are somewhat different from data from the 1986–87 NPSAS. Rather than representing all students enrolled in postsecondary education at a particular point in time, HS&B represents a specific cohort of students who were high school seniors in 1980. Although data from the 1980 seniors may not accurately reflect the attitudes of all undergraduates, the data do represent younger undergraduates (23 years old or younger).

The Integrated Postsecondary Data System (IPEDS) is an extension and expansion of earlier data collection efforts by NCES and began with surveys for the 1986-87 school year. Building on the Higher Education General Information Survey (HEGIS), IPEDS includes data on all 4-year institutions, all 2-year institutions, all public less-than-2-year institutions, and a sample of private nonprofit and private for-profit less-than-two-year institutions.

Because this report presents many detailed statistics in the text and appendices, it can serve as a valuable reference. Statistics of major interest are highlighted graphically and discussed in the text to help users use and interpret the data. The ultimate goal is to publish a series of reports presenting trend data. However, the majority of the statistics included in this report cover Fall 1986 only, because very few comparable trend data are currently available. This problem will be partially solved when the NPSAS—first done in Fall 1986—is established as a regular data collection repeated every three years.

## Organization of the Report

This report relies primarily on data for the fall of 1986 to profile undergraduate students enrolled in postsecondary institutions. Each chapter emphasizes one particular aspect of enrollment. Chapter II provides an overview of undergraduate enrollment in recent; ears and is based on data from the Integrated Postsecondary Education Data System. Chapter III presents data on students' demographic and socioeconomic characteristics, including sex, race, age, marital status, number of dependent children, citizenship status, veteran status, income, and father's education and occupation. Chapter IV describe their academic preparation in high school. Chapter V presents information on students' enrollment characteristics: what types of institutions students attended, whether students were part- or full-time, whether they lived on or off campus, what they were studying, and what remedial education they received. Chapter VI describes students' sources of support, looking at financially dependent and independent

<sup>&</sup>lt;sup>1</sup>Roslyn Korb et al., Undergraduate Financing of Postsecondary Education. A Report of the National Postsecondary Student Aid Study, Washington, D.C., National Center for Education Statistics, U.S. Department of Education, 1988, CS 88-239.

students separately. Chapter VII describes students' educational goals and examines their attitudes and voting patterns. This report presents all of this information for undergraduates as a group, and also separately for students with different demographic and socioeconomic characteristics and for those attending different types of institutions.

The report contains three appendices: Appendix A is a glossary that describes each row and column variable included in the tables. For each variable, the gloss ary indicates the source of the data (whether it came from the Student Questionnaire, the Parent Questionnaire, the Institutional Record, or was derived by NCES or MPR Associates) and defines each category in detail. Appendix B provides technical information on the data used. Appendix C presents supplemental tables.

Each chapter contains a series of tables that present data related to the chapter's topic, preceded by a brief written and graphic summary of the highlights. The tables in Chapter II show actual numbers of students enrolled, but those in the remaining chapters show percentages only—sperifically, row percentages. For example, the entry in the second row (males), third column (Asians) of Table III.1 indicates that 6.1 percent of the male students were Asian. To find the percentage of Asian students who were male, one can refer to the fourth row (Asians), first column (males) of the same table. Although it is not always possible to find this type of complementary information in one table, the information is usually available elsewhere in the report. For example, Table III.1 shows that 46.2 percent of full-time students are male. By referring to Table V.2 in Chapter V, which describes enrollment characteristics, one can find that 64.1 percent of males were enrolled full-time.

Differences among groups reported throughout the text were evaluated using a two-uned t-test. Unless otherwise noted, differences reported were significant to the  $p \le .05$  level for each family of tests. An explanation of the procedure used is given in the technical notes and methodology section (Appendix B). Not all significant findings are discussed.

#### CHAPTER II

# OVERVIEW OF UNDERGRADUATE ENROLLMEN'T

In the fall of 1987, 12.4 million undergraduate students were enrolled in American postsecondary institutions: 7.6 million on a full-time basis and 4.8 million on a part-time basis (Table II.1). Slightly more than one-half of these students (5.5 million) were enrolled in 4-year institutions. A majority of the rest (5.1 million) were enrolled in 2-year institutions. A total of 833,000 were enrolled in less-than-2-year institutions.

In 2- and 4-year institutions, the majority of students were enrolled in public, rather than private institutions (Table II.2). In less-than-2-year institutions, on the other hand, the private, for-profit sector dominated, with 73 percent of the enrollment. Chapter V presents additional information on the types of institutions attended by students.

Between 1969 and 1986, total undergraduate enrollment in institutions of higher education (a subset of all postsecondary institutions) grew from 6.9 million to 10.8 million, an increase of 57 percent (Table II.2). Most of this growth occurred in the 1970s, with total enrollment reaching 10.5 million in 1980. However, between 1981 and 1986, enrollment remained relatively constant, around 10.8 million. These numbers are smaller than the total of 12.4 million shown in Table II.1 for the following reason: Table II.2 includes only enrollment in institutions of higher education, while Table II.1 includes enrollment in all postsecondary institutions, a broader category. The term "institutions of higher education" refers to institutions that are accredited by an organization recognized by the Secretary of Education.

The greatest change occurred in part-time enrollment, which increased 132 percent (from 1.9 million to 4.4 million) between 1969 and 1986 (Table II.2 and Figure II.1). Full-time enrollment, on the other hand, grew only 26 percent during this period. Part-time enrollment of females more than tripled, growing from 837,000 in 1969 to 2.6 million in 1986. Part-time enrollment of males grew 73 percent, from 1.1 million in 1969 to 1.9 million in 1986.

Growth has been greater in the public sector than in the private sector. In 1969, 5.2 million undergraduate students were enrolled in public institutions of higher education. By 1986, the number had risen to 8.7 million, an increase of 67 percent (Figure II.2). Growth in private institutions during the same period was a much more modest 24 percent, from 1.7 million to 2.1

<sup>&</sup>lt;sup>2</sup> These numbers are smaller than the total of 12.4 million shown in Table I.1: Table I.2 includes only enrollment in institutions of higher education, while Table I.1 includes enrollment in all postsecondary institutions, a broader category. The term "institutions of higher education" refers to institutions that are accredited by an organization recognized by the Secretary of Education.

<sup>&</sup>lt;sup>1</sup>Note that fall enrollment differs from full-year enrollment. This distinction can be important when counting students in less-than-four-year institutions, many of which have short-term programs. A count of fall enrollment can understate significantly the number of students who enroll during a year.

## **CHAPTER III**

## DEMOGRAPHIC AND SOCIDECONOMIC CHARACTERISTICS

Undergraduates came from a wide range of demographic and sociceconomic backgroads. This chapter presents information on their sex, race/ethnicity, age, family, citizenship and values status, income, and father's education and occupation.

## Sex, Race/Ethnicity, and Age

Among undergraduates encolled in fall 1986, 45 percent were male and 55 percent were female (Table III.1 and Figure III.1). In a number of subgroups, more than 60 percent of the students were female. These subgroups included: blacks, Native Americans, students who were over 30 years old, students from very low income families (less than \$11,000 annually), independent students (at most income levels), students seeking a certificate or no formal award, students undecided about an educational goal, students enrolled in less-than-2-year institutions, and students attending private, for-profit institutions.

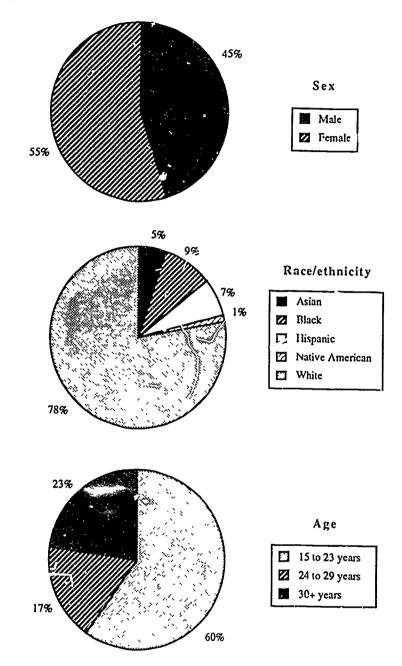

More than three-fourths (78 percent) of the undergraduates in fall 1986 were white. Blacks, Hispanics, and Asians accounted for nine, seven, and 5 percent of the student populations, respectively. Only 1 percent were Native Americans. However, the racial/ethnic composition varied by type of institution. Whites made up 82 percent of the student population at 4-year, Ph.D.-granting institutions, Lat only 60 percent at less-than-2-year institutions. Blacks, on the other hand, made up only 7 percent of the population at 4-year, Ph.D.-granting institutions, but 20 percent at less-than-2-year institutions. Hispanics accounted for 4 percent of the population at 4-year, Ph.D.-granting institutions. Asians accounted for 6 percent of the population at 4-year Ph.D.-granting institutions, but 4 percent at less-than-2-year institutions.

The majority (60 percent) of the undergraduates in fall 1986 were in the traditional college age category of 23 years old or younger, but almost one-fourth (23 percent) were 30 years old or older. Females were more likely than males to be in the oldest age group: 26 percent of the females were 30 years old or older, compared to 18 percent of the males. Financially independent students were more likely than financially dependent students to be in the oldest age group (55 percent compared to 4 percent). Part-time students were more likely than full-time students to be 30 years old or older (42 percent compared to 11 percent). Students who worked full-time were much more likely to be in the oldest age group than were those who worked part-time or not at all (44 percent compared to 15 and 19 percent, respectively). Finally, students attending less-than 2-year or 2-year institutions were more likely to be in the oldest age group than were students enrolled in 4-year institutions.

#### Family Charact ristics

The majority of the fall 1986 undergraduates were single and childless (Table III.2 and Figure III.2). Seventy-six percent of the students were single, and 24 percent were married. Eighty-seven percent had no dependent children, 5 percent had one dependent child, and 8 percent had two or more dependent children. Family characteristics were closely related to age and to students' financial status. For example, 94 percent of the students who were 23 years old or younger, 86 percent of those who earned \$1-\$11,000 annually, and 95 percent of those who were financially dependent on their parents were single. On the other hand, 62 percent of the students 30 years old or older, 69 percent of those who earned \$30,000 or more, and 56 percent of those who were financially independent were married. Of the students who were 30 years old or older, 12 percent had one dependent child, and 27 percent had two or more dependent children.

The types of institutions with the greatest proportions of married undergraduates were the public, less-than-2-year and public, 2 year institutions, in which more than one-third of the students were married and approximately one-tifth had children. In contrast, at 4-year, Ph.D.-granting institutions, only 14 percent of the students were married, and at 4-year, non-Ph.D.-granting institutions, only 19 percent were married.

## Citizenship and Veteran Status

Overall, 96 percent of the fall 1986 undergraduates were U.S. citizens. Three percent were resident aliens, and 1 percent were non-resident aliens (Table III.3). Asians and Hispanics were least likely to be U.S. citizens. Only 63 percent of Asians and 84 percent of Hispanics were citizens, compared to 95 percent or more of blacks, whites, and Native Americans. Asians were much more likely than any other group of students to be non-resident aliens: 9 percent were in this category, compared to 2 percent of blacks and Hispanics and less than 1 percent of whites and Native Americans (Figure III.3).

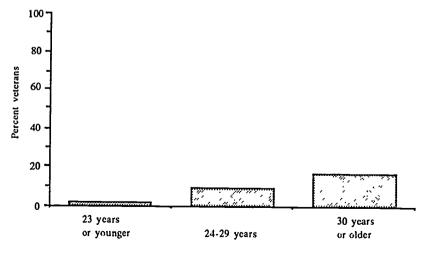

Relatively few students were veterans—only 7 percent (Table III.3 and Figure III 4). Among the males, however, 13 percent were in this category. Older students were much more likely than younger students to be veterans. Seventeen percent of those 30 years old or older were veterans, compared to only 2 percent of those 23 or younger and 9 percent of those 24 to 29 years old.

#### Income

Approximately one-half of the fall 1986 undergraduates came (according to their report) from families with annual incomes of \$30,000 or more, and almost one-fourth came from families with incomes of \$50,000 or more (Table III.4 and Figure III.5). There were marked differences in family income by race/ethnicity, however. While 26 percent of the white students and 21 percent of the Asians reported family incomes of \$50,000 or more, only 8 percent of blacks, 12 percent of Hispanics, and 9 percent of Native Americans reported family incomes in this cate, 30ry. At the other end of the income scale, only 10 percent of the white students came from families with annual incomes of less than \$11,000, compared to 21 percent of the Asians, 31 percent of the blacks, 25 percent of the Hispanics, and 24 percent of the Native Americans.

Family income and financial dependency status were also related. Of the independent students, 24 percent came from families with incomes of less than \$11,000, and only 14 percent came from families with incomes of \$50,000 or more. In comparison, only 9 percent of the dependent students came from families with incomes of less than \$11,000, and 28 percent came from families with incomes of \$50,000 or more. Tables III.5 and III.6 show family income by selected student and institutional characteristics for dependent and independent students separately. Note that family income in these two tables refers to actual income rather than student-reported family income status. The glossary in Appendix A describes this difference in detail.

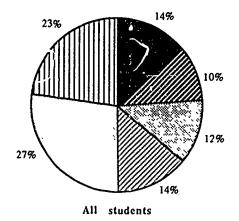

Students at the various types of institutions tended to have different family incomes. The institutions offering short-term vocational programs (private, for profit and public, less-than-2-year institutions) had the most students from low income families. approximately 30 percent were in the less than \$11,000 category. however, no more than 13 percent were in this category at any of the 4-year institutions. Private, nonprofit, 4-year, Ph.D.-granting institutions had the wealthiest students: 42 percent of their students came from families with incomes of \$50,000 or more, and only 7 percent came from families with incomes of less than \$11,000.

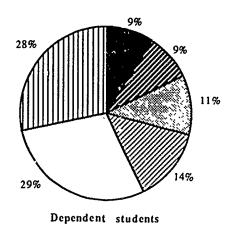

<sup>&</sup>lt;sup>1</sup>There are two measures of family income. "Family income status" is the student's estimate of parent income. "Dependent student's family income" is from the financial aid record if the student had one, from the parent's questionnaire if there was no financial aid record, and imputed if there was no questionnaire.

### Father's Education and Occupation

Approximately one-half of the fall 1986 undergraduates had fathers with only a high school diploma or less (Table III.7).<sup>2</sup> Approximately one-fourth had fathers with vocational or associate degrees, and one-fourth had fathers with bachelor's or advanced degrees. Asian students had fathers with particularly high levels of education: 22 percent of their fathers had a bachelor's degree, and another 13 percent had an advanced degree. Among Hispanic students, on the other hand, 41 percent of their fathers had less than a high school diploma. White students were the least likely to have fathers with less than a high school diploma (13 percent).

Students' educational goals were related to their fathers' education. For example, students seeking a bachelo,'s degree were much more likely than students seeking a certificate or an associate degree to have fathers with bachelor's or advanced degrees. Among the s'udents seeking a bachelor's degree, 33 percent had fathers with a bachelor's or advanced degree. In contrast, only 13 percent of those seeking a certificate or award and 14 percent of those seeking an associate degree had fathers with bachelor's or advanced degrees.

The types of institutions students attended were also related to their fathers' education. Among the students attending less-than-2-year institutions, 72 percent had fathers with only a high school diploma or less (Figure III.6). Only 7 percent had fathers with a bachelor's degree, and only 3 percent had fathers with an advanced degree. In contrast, among the students enrolled in 4-year Ph.D.-granting institutions, only 32 percent had fathers with a high school diploma or less, while 22 percent had a bachelor's degree and 17 percent had an advanced degree.

Among the fall 1986 undergraduates, the most common fathers' occupations (Table III.8) were manager (18 percent), professional (15 percent), and crafts (14 percent). For a relat vely high proportion of students (27 percent) either the father's occupation was unknown or the father was not working. Although there appears to be some variation in the father's occupation depending on race, income, and type of institution, the relatively large percentages of unknown/not working make it difficult to draw conclusions.

<sup>&</sup>lt;sup>2</sup>About 7 percent of the undergraduates in the NPSAS survey either did not know or did not specify the highest level of education completed by their father or male guardian. These students were not included in the distribution shown in Table III.7 or in Figure III.5.

#### CHAPTER IV

### ACADEMIC PREPARATION

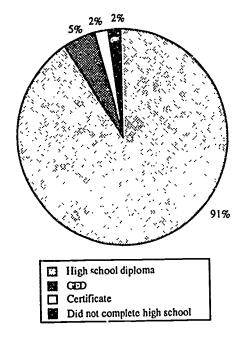

This chapter presents a series of tables from various sources to escribe the academic background of students enrolled in postsecondary education.

# High School Graduation

The vast majority of the fall of 1986 undergraduates (91 percent) received their high school diplomas before entering a postsecondary institution (Figure IV.1 and Table IV.1). Approximately 5 percent received a GED, 2 percent received a certificate of completion, and the remaining 2 percent did not receive a high school diploma or its equivalent. Not all groups of undergraduates were equally likely to have received a high school diploma. Whites were more likely to have obtained a diploma (93 percent) than Asians (81 percent), blacks (86 percent), Hispanics (81 percent), or Native Americans (74 percent). Undergraduates in the youngest age group (23 years old or younger) were also more likely (95 percent) than students who were in the two older age groups—24 to 29 years old (86 percent) and 30 years old or older (83 percent)—to have completed high school.

Seventy percent of the undergraduates at less-than-2-year institutions received a regular high school diploma. In comparison, larger proportions of students at institutions with higher course-offering levels obtained high school diplomas: 86 percent of those attending 2-year institutions and approximately 96 percent of those attending 4-year institutions received high school diplomas.

Figure IV.1--Percentage distribution of undergraduates, by high school education: Fall 1986

# High School Concentrations

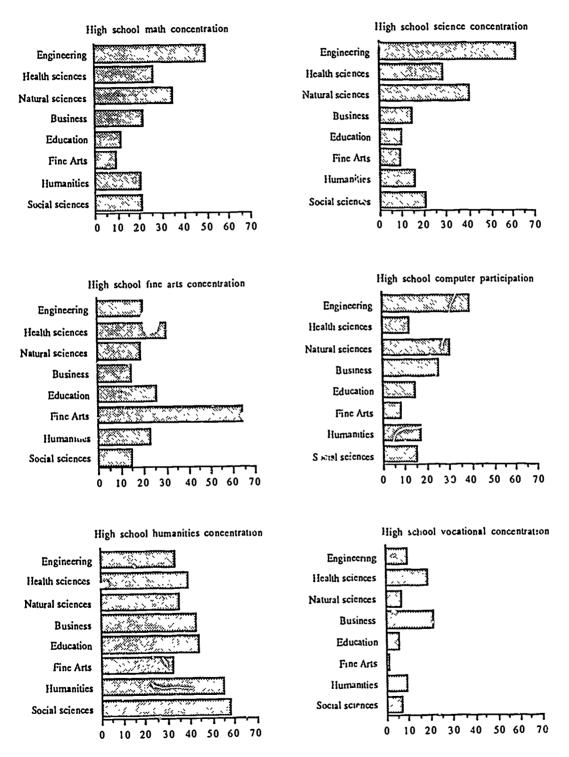

Data on the High School and Beyond 1980 sophomore cohort suggest that students' postsecondary concentration was to some extent consistent with their high school concentrations (Tables IV.2a and b and Figure IV.2). For example, 48 percent of the students with postsecondary technical vocational concentrations had secondary vocational concentrations. Students with postsecondary academic concentrations were much less likely to have had secondary vocational concentrations: no category had more than 21 percent of its students as high school vocational concentrators, and most had much smaller percentages.

Among the students with postsecondary academic concentrations, there were also similarities between students' secondary and postsecondary coursework focus. For example, among the 1980 sophomores who had natural science postsecondary concentrations, 41 percent were less likely to have had science concentrations in high school. Students with other postsecondary concentrations of all students with postsecondary concentrations in high school. For example, only 15 percent postsecondary concentrations in education, 9 percent of all students in fine rts, 16 percent of all students in the humanities, and 20 percent of all students in the social sciences had high school concentrations in science.

<sup>&</sup>lt;sup>1</sup>Students were considered vocational concentrators if they completed four or more credits of vocational education in a single occupational area (for example, business, agriculture, etc.).

#### SAT and ACT Scores

SAT and . 'Cr' scores are among the most widely reported measures of academic preparation. Overall, Scholastic Aptitude Test (SAT) scores for college-bound seniors declined somewhat between 1966-67 and 1986-87. Through the late 1960s and 1970s verbal and math SAT scores steadily declined. Since 1980-81, however, average test scores for college-bound seniors have increased slightly. For example, average verbal SAT scores steadily declined from 466 in 1966-67 to 424 in 1979-80, but they increased to 430 in 1986-87 (Figure IV.3 and Table IV.3). Mathematics test scores followed similar patterns.

ACT scores for English have followed a similar pattern (Table IV.4). They declined in the early 1970s, but have shown an overall increase sinc then. ACT mathematics scores, on the other hand, declined along with the English scores but have continued to decline.

### CHAPTER V

## **ENROLLMENT CHARACTERISTICS**

This chapter presents information on the types of institutions fall 1986 undergraduates attended, their attendance status (fuli- or part-time), their housing arrangements, their fields of study, and their participation in remedial education.

# Types of Institutions Attended

Students in this country who want to further their education beyond high school have a wide range of options. They can choose from short-term vocational training programs, 2-year institutions that provide vocational training or the first two years of college coursework for students who later wish to transfer to 4-year institutions, and 4-year institutions that offer a bachelor's degree. They can also choose between public and private institutions, and within the private sector between for-profit and nonprofit institutions.

In the fall of 1986, 77 percent of all students enrolled in postsecondary institutions attended public institutions (Table V.1 and Figure V.1). Eighteen percent attended private, nonprofit institutions, and 5 percent attended private, for-profit institutions. In the public sector approximately equal proportions of students were enrolled in 4-year and less-than-4-year institutions. In contrast, almost all students who attended private, nonprofit institutions were enrolled in 4-year institutions, and virtually all students who attended p. ate, for-profit institutions were enrolled in less-than-4-year institutions.

The choice of institution type varied with students' race/ethnicity, age, income, and parents' education. Asians, blacks, and especially Hispanics were less ikely than whites or Native Americans to attend private, nonprofit institutions. Nineteen percent of whites and Native Americans attended private, nonprofit institutions, compared to 15 percent of Asians, 15 percent of blacks, and 11 percent of Hispanics. Larger proportions of Asians and whites than of either blacks, Hispanics, or Native Americans attended public, 4-year institutions: 39 percent of Asians and whites compared to 34 percent of blacks, 27 percent of Hispanics, and 27 percent of Native Americans. All minority groups except blacks were more likely than whites to attend public, 2-year institutions. Much greater proportions of blacks and Hispanics than of whites, Asians, or Native Americans attended private, for-profit institutions.

Students 23 years old or younger were much more likely than those 24 years old or older to attend private, nonprofit institutions: 22 percent of the students 23 years old or younger attended private, nonprofit institutions, compared to only 12 percent of structures between 24 and 29 years old or 30 years old or older. On the other hand, older students were more likely than younger ones to attend public, 2-year institutions. In the 30 years old or older age group, 56 percentatended public, 2-year institutions, compared to 27 percent of the 23 years old or younger group.

Family income was related to the type of institution at nded. More than one-half of the students from the lowest income families attended less-than t-year institutions. 43 percent attended 2-year public institutions, 2 percent attended public less-than-2-year institutions, and 9 percent attended private, for-profit institutions. In contrast, only 26 percent of students from families with annual incomes of \$50,000 or more attended public, 2-year institutions, less than 1 percent attended public, less-than-2-year institutions, and only 2 percent attended private, for-profit institutions. The lowest income students were much less likely than the highest income students to attend private, nonprofit 4-year institutions (14 percent compared to 26 percent).

<sup>44</sup> 57

Students who were financially dependent on their parents were more likely than those who were independent to attend private, nonprofit institutions (22 percent compared to 12 percent). Independent students, on the other hand, were more likely than dependent ones to attend private, for-profit institutions (8 percent compared to 4 percent). Within the public sector, dependent students were more likely than independent ones to attend 4-year institutions, and independent students were more likely than dependent ones to attend 2-year and less-than-2-year institutions.

The types of institutions students attended were also related to their parents' education. Students whose mothers or fathers had advanced degrees were much more likely than those with less well-educated parents to attend private, nonprofit, 4-year institutions or public, 4-year, Ph.D.-granting institutions. They were also much less likely to have attended public, 2-year, public, less-than-2-year; or private, for-profit institutions.

third of the students in the Northeast attended private, nonprofit institutions—a much higher proportion than found in the rest of the country. In the Midwest, 17 percent attended private, nonprofit institutions; in the South, 13 percent; and in the West, only  $\xi$  percent. Students in the West were the most likely to attend public, 2-year institutions. The percentage of students who enrolled in public, 2-year institutions was 51 percent in the West, compared to 25 percent in the Northeast, 34 percent in the Midwest, and 43 percent in the South.

#### Attendance Status

Despite the increasing popularity of part-time enrollment, the majority of postsecondary students were enrolled full-time (according to their institutions' definition). Overall, 62 percent of the students who attended postsecondary institutions in the fall of 1986 were enrolled full-time, and 38 percent part-time (Table V.2). In all types of institutions except public, 2-year, more than 70 percent of the students were enrolled full-time, and in some types of private institutions more than 80 percent were enrolled full-time (Figure V.3). In public, 2-year institutions part-time students were a majority: 64 percent of their students were enrolled part-time.

Males were more likely than females to be enrolled full-time. 64 percent compared to 61 percent (Figure V.2). Approximately 63 percent of Asians, blacks, and whites were enrolled full-time. Hispanics and Native Americans were less likely to be enrolled 'ull-time (58 and 49 percent, respectively).

Younger students were more likely than older students to be enrolled full-time. Among the students 23 years old or younger, 79 percent were enrolled full-time, while only 44 percent of those between 24 to 29 years old, and 31 percent of those 30 years old or older were enrolled full-time (Figure V.2). The percentages varied by type of institution, however (Appendix C: Tables C.V.1 and C.V.2). At private, nonprofit, 4-year institutions, more than 90 percent of the youngest group were enrolled full-time. On the other hand, at public, 2-year institutions, only 53 percent of the youngest group were enrolled full-time.

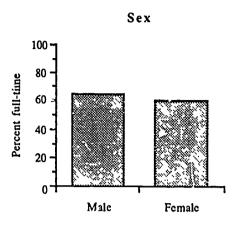

Attendance status was related to educational objective. Students seeking a bachelor's degree were the most likely to attend full-time (76 percent). Only 49 percent of the students seeking an associate degree and 17 percent of those seeking no formal award attended full-time (Figure V.3).

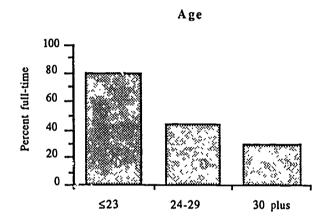

Employment status also reflected the likelihood of being enrolled full-time. Among the students who worked full-time, only 20 percent were full-time students, among those who worked part-time, 70 percent were full-time students, and among those who were unemployed, 78 percent were full-time students.

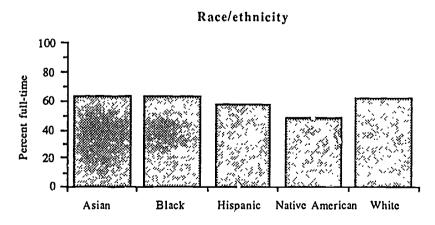

<sup>&</sup>lt;sup>1</sup>Tables C.V.1 and C.V.2 in Appendix C present the same information as Table V.2, but for each institutional type separately.

Figure V.2--Percentage of students who were full-time, by sex, age, and race/ethnicity: Fall 1986

### **Housing Arrangements**

Fifty percent of all undergraduates lived off-ampus, not with parents (Table 7.3 and Figure V.4). Another 30 percent lived with their parents, and the remairing 20 percent lived in school-owned housing. Younger students were far more likely than older ones to live in school-owned housing. Thirty-one percent of the students who were 23 years old or younger lived in school-owned housing, compared to only 4 percent of those between 24 to 29 years old and 1 percent of those 30 years old or older. Students in the youngest group were also more likely than the older students to live with their parents. 41 percent lived with their parents, compared to only 23 percent of the students between 24 to 29 years old and 6 percent of the students 30 years old or older.

Housing arrangements varied with the control and type of institution. Almost one-half (46 percent) of the students in private, nonprofit, institutions lived in school-owned housing, compared to 15 percent of the students in public institutions and only 2 percent of the students in private, for-profit institutions. Approximately one-third of the students in 4-year institutions lived in school-owned housing. Most less-than-4-year institutions do not provide housing. Only 3 percent of the students in 2-year institutions and 1 percent in less-than-2-year institutions lived in school-owned housing.<sup>2</sup>

### Fields of Study

Tables V.4a and b and Figure V.5 show students' fields of study.<sup>3</sup> Business/marketing was the most commonly reported field, with 29 percent of all students reporting it as their field of study. The second most commonly reported field was technical and engineering, with 16 percent of all students reporting it as their field of study.

Fields of study are most interesting to examine when considering students' educational objectives. Approximately three-fourths of the students seeking certificates were in four fields: business/marketing (31 percent), trades and industry (15 percent), technical and engineering (15 percent), and health (13 percent). Students seeking associate degrees were also concentrated in degrees were enrolled in the technical and engineering (19 percent) and health (13 percent) fields. Students seeking bachelor's degrees were also concentrated in business/marketing (26 percent), although not as heavily as students with other objectives. The next most popular fields for students seeking bachelor's degrees were technical and engineering (16 percent), education and public service (11 percent), and social science (11 percent).

Approximately one-fourth of all males were in business, and one-fourth were in technical and engineering fields. Business was a popular field for females, too, with 31 percent of females enrolled. However, only 8 percent of females were in technical and engineering fields. Greater proportions of females than males were enrolled in health (14 percent compared to 4 percent) and education/public service (12 percent compared to 8 percent).

Tables C.V.5 through C.V.7 in Appendix C show the proportions of students in each field of study separately for students seeking certificates or diplomas, associate degrees, and bachelor's degrees. At every level, there were marked differences in field of study by sex.

<sup>&</sup>lt;sup>3</sup>Field of study was taken from the Student Record provided by the institution if possible. For students whose field of study was missing or uncodable, the field of study reported by the student was used. For 20 percent of the students, no information on field of study was available from either source.

#### Remedial Education

Overall, 18 percent of students took some remedial education the first year they were enrolled in the postsecondary institution they attended in the fall of 1985. Eight percent took some remedial education in reading, 10 percent in writing, and 12 percent in math (Table V.5). Areas. Among the different racial and ethnic groups, whites were the least likely have taken any remedial education. Regarding the type of institution, students in public, 2-year and public, 4-year, non-Ph.D.-granting institutions were the most akely to have taken remedial education, p.rticularly in math (Figure V.6).

Figure V.6--Percentage of students reporting receiving remedial education in reading, writing, or math by type of institution: Fall 1986

#### CHAPTER VI

#### SOURCES OF FINANCIAL SUPPORT

Undergraduates relied on a variety of resources to meet their educational expenses. Most used some combination of their own assets from earnings and savings, contributions from parents, relatives, and friends, and/or financial aid. This chapter describes the extent to which fall 1986 undergraduates relied on these various sources of support, as well as specifies the average amounts of student aid awarded to various groups of undergraduat s. The final section describes employment and earnings for fall 1986 undergraduates.

The financial aid system categorizes students into two groups—dependent and independent—based on the amount of financial support they have received from their parent(s) Students were considered financially dependent if, during the previous two years, they lived with their parents for six or more weeks, received \$750 or more from them or were claimed as a dependent on their parents' income tax statements. Correspondingly, students were considered financially independent if they did not meet any of these criteria. Because the financial circumstances of independent and dependent students vary so much, separate tables on the sources of support are included in this section.

## **Dependency Status**

In the fall of 1986, 63 percent of all under raduates were financially dependent their parents (Figure VI.1 and Table VI.1). Approximately 68 percent of all male and 59 percent of all fer ale undergraduates were financially dependent. Not surprisingly, financial dependency was closely associated with the student's age. Younger students were much more likely to be dependent on their parents than were their older counterparts. Ninety percent of the students 23 years old or younger were financially dependent. In contrast, 37 percent of the students between 24 and 29 years old and 11 percent of the students 30 years old or older were financially dependent. Full-time students were more likely than part-time students to be financially dependent (76 percent compared to 42 percent).

## Sources of Support

#### Student Contributions

Regardless of their dependency status, approximately three-fourths of all undergraduates contributed toward financing their own education or received financial support from their spouses (Figure VI.2 and Tables VI.2 and VI.3). Students who worked were more likely than those who did not work to contribute. This pattern was found among both dependent and independent undergraduates enrolled in the full of 1986. For example, more than 80 percent of the financially dependent undergraduates who worked full-time and a similar percentage of those who worked part-time contributed somewhat to their educational expenses. In contrast, only about two-thirds of the dependent students who were not employed made contributions.

#### Parent Contributions

Eighty-seven percent of all dependent undergraduates received some parental contribution to their postsecondary education. However, dependent students who were enrolled part-time were far less likely to have received parental contributions than dependent students who were enrolled full-time (72 percent compared to 91 percent). Receipt of parental contributions was also related to the student's degree objective. Financially dependent undergraduates who were working towards their bachelor's degrees were much more likely to have received assistance from their families than students planning to complete shorter academic programs, either an associate degree or a certificate (91 percent compared to 81 percent). Furthermore, parental contributions were less common among students who were not planning to obtain a formal award (64 percent) than among students who were working toward some type of degree.

Only 17 percent of the financially independent students received financial contributions from their parents. Among independent undergraduates, younger students were more likely than their older counterparts to have received parent contributions. Thirty-eight percent of the independent students 23 years old or younger received parental aid. In comparison, only 20 percent of those between 24 and 29 years old and nine percent of those 30 years old or older received parental contributions.

#### Financial Aid

Financial aid was an important source of support for many undergraduates. Fifty percent of the independent and 48 percent of the dependent students received either federal, state, institutional, or other aid. Not surprisingly, students from lower income families were more likely to have received financial aid than their peers from higher income families. For example, 65 percent of the dependent undergraduates who had annual family incomes of less than \$11,000 received student aid. In contrast, only 27 percent of the dependent undergraduates who had annual family incomes of \$50,000 or more received aid.

<sup>1</sup> Although it may seem contradictory, not all students who were financially dependent received contributions from their parents. Students' financial dependency status was determined by examining parental support during the previous two years. Some of the students who received parental support either in 1984-85 or in 1985-86 may not have received parental support in 1986-87, the year of the NPSAS survey.

71

Total student aid awarded to dependent recipients averaged \$2,625, while total student aid awarded to independent undergraduates averaged \$2,721. Aided students who were enrolled in public institutions received less financial \_d than their counterparts at private institutions. Among dependent students, those at public institutions averaged \$2,200 in aid, while those at private, nonprofit institutions averaged \$3,196 and those at private, for-profit institutions averaged \$3,356. Similar amounts of aid were received by financially independent undergraduates at each type of postsecondary institution.

Both independent and dependent students used federal aid as a source of support. Thirty-three percent of the dependent students and 37 percent of the independent students received federal aid in the form of loans, grants, or college work study. Regardless of their dependency status, undergraduates enrolled in less-than-2-year programs were more likely to have received aid than students enrolled in programs of longer duration. Three-fourths of the independent undergraduates at less-than-2-year programs were awarded federal aid. Among independent students at other institutions, only 27 percent of the undergraduates at 2-year institutions, 43 percent of the students at 4-year non-Ph.D.-granting institutions, and 46 percent of the students at 4-year Ph.D.-granting institutions received federal aid. Among dependent undergraduates, there was a similar pattern; the highest proportion of aid recipients was at less-than-2-year institutions and the smallest fraction was at 2-year institutions.

#### Student Employment and Earnings

More than one-half of the undergraduates enrolled during the fall of 1986 vorked either full- or part-time while they were in school (Figure VI.3 and Table VI.4). Fifty-nine percent worked either part- or full-time during the fall of 1986, and 57 percent during the following spring. An additional 7 percent of the undergraduates were looking for work during the fall semester. First-time undergraduates were somewhat less likely to be working in the fall of 1986 than students in their second or later years. About 54 percent of the first-year students worked, compared to 62 percent of the second year students, 60 percent of the third-year students, and 61 percent of the fourth- or later-year students.

On the average, undergraduates employed during the fall semester worked 29 hours per week and earned \$6.77 per hour. Fall of 1986 undergraduates who worked during the spring semester averaged about 30 hours per week and earned \$6.84 per hour. Employment while in school was clearly related to the student's attendance status. Close to one half of the students who were enrolled full-time worked, in contrast to over more than three-fourths of the standard who were enrolled part-time. Furthermore, students who were enrolled part-time worked to the standard status and had higher hourly wages.

#### **CHAPTER VII**

## EDUCATIONAL OBJECTIVES AND COLLEGE CHOICE

## Educational Objectives

Slightly more than one-half of the students enrolled in Fall 1986 had a bachelon's degree as their current educational objective (Table VII.1 and Figure VII.1). Twenty-two percent were working toward associate degrees, 9 percent toward certificates, and 6 percent toward some other type of postsecondary credential. 6 percent were not seeking any formal award, and 3 percent were undecided. Males were slightly more likely than females to be seeking a bachelor's degree (57 percent compared to 50 percent).

Approximately 55 percent of both Asians and whites had a bachelor's degree as their objective. Smaller percentages of blacks, Hispanics, and Native Americans had this objective (46 percent, 42 percent, and 32 percent, respectively). Among all the racial/ethnic groups, Asians and whites were least likely to be seeking certificates. Only 8 percent had this goal, compared to 14 percent of blacks, 16 percent of Hispanics, and 15 percent of Native Americans.

Almost two-thirds (65 percent) of the students aged 23 years old or younger had a bachelor's degree as their objective, and another 19 percent were working toward an associate degree. On the other hand, older students as a group had more varied objectives. Among the students 30 years old or older, 30 percent were working toward bachelor's degrees, 27 percent toward associate degrees, 15 percent toward certificates, and 11 per and some other type of credential. In addition, 13 percent sought no formal award and 3 and were undecided.

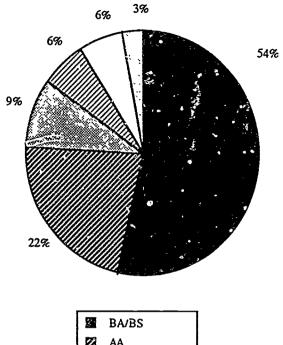

Among the students from families in which the father had not graduated from high school, 37 percent were working toward bachelor's degrees. Another 29 percent were working toward associate degrees, and 15 percent were working toward certificates. In contrast, 70 percent of the students whose fathers had an advanced degree were working toward bachelor's degrees. Only 10 percent of these students were working toward associate degrees, and only 4 percent toward certificates. Mothers' education had a similar relationship to students' current degree objectives, students whose mothers had a higher education had higher objectives than a dents whose mothers had relatively less education.

<sup>&</sup>lt;sup>1</sup> Certificates are commonly awarded to students who complete vocational programs at 2 year and less than 2 year institutions. Other types of postsecondary credentials include program licenses typically offered by ocational schools or technical in itutes.

## College Choice

Undergraduates enrolled during the fall of 1986 identified several factors as important in selecting a postsecondary institution (Table VII.2 and Figure VII.2). Seventy-five percent of the students indicated that the quality of the academic program was a very important consideration in their choice of institution. Furthermore, responses from parents tended to support the answers parent by the students. Seventy-seven percent of the parents indicated that the academic program had been an important factor in their sons' or daughters' choice of institution. Other factors that were considered very important by a majority of undergraduates included the institution's reputation (which 55 percent of the students said was very important); financial considerations (which 52 percent said were very important); and personal considerations (which 52 percent said were very important). In addition, geographic location was a very important factor to 40 percent of the students in selecting their institutions.

Figure VII.2--Percentages of parents and students reporting different factors as important in postsecondary choice: Fall 1986

## Appendix A

#### **GLOSSARY**

This glossary describes the variables used in this report. The source for each variable is indicated in the heading. For NPSAS variables, if the variable was used exactly as reported, the data collection instrument and question number are identified in the heading as well. Variables from the Student Questionnaire are denoted by an "S," variables from the Parent Questionnaire by a "P," and variables from the Updated Student Record by an "R."

Some variables were derived by NCES or MPR Associates either using information from several sources or developing categories based on the original data. These variables are labeled "NCES-derived" or "MPR-derived." A brief description of how they were derived is included in the description of the variable. More detailed explanations of NCES-derived variables can be found in the National Postsecondary Student Aid Study Updated Record and Student Questionnaire (1987) Data File User's Manual (Longitudinal Studies Branch, Postsecondary Education Statistics Division, Washington, D.C.: National Center for Education Statistics, U.S. Department of Education, March 1989).

Variables from High School and Beyond are denoted "HS&B." Additiona! information on these variables can be found in the High School and Beyond 1980 Sophomore Cohort Third Follow-Up (1986) Data File User's Manual (P. Sebring et al., Chicago: National Opinion Research Center, October 1987) or in the source noted in the description.

The row variables are described first, presented in the following order:

- Student demographic characteristics (sex, race/ethnicity, age),
- Student socioeconomic characteristics (income, parents' education and occupations),
- Student educational characteristics and employment status (attendance status, educational objective, enrollment level, educational attainment, employment status),
- Institutional characteristics (level, control, type, geographic region).

Many of the column variables are row variables as well. Descriptions of column variables that do not also appear as row variables are organized by chapter and, within chapter, in the order they appear in the tables.

#### ROW VARIABLES

Student Demographic Characteristics

Sex. (NPSAS, NCES-derived)

For students who reported their sex on the Student Questionnaire, NCES used the information from the Student Questionnaire (S75). Otherwise, the sex reported on School Record (R12) was used.

105

## Racelethnicity (NPSAS, NCES-derived)

For students who reported their race/ethnicity on the Student Question aire, NCES used the information from the student questionnaire (\$76 and \$77). Otherwise, the race/ethnicity reported on School Record (R14) was used.

Asian

Asian or Pacific Islander

Black

Black, not of Hispanic origin

Hispanic

Hispanic (Mexican American, Puerto Rican, Cuban, or other Hispanic)

Native American

Native American or Native Alaskan

White

White, not of Hispanic origin

## Age (NPSAS, NCES- and MPR-derived)

NCES computed each student's age from the date of birth. For students who reported their date of birth on the Student Questionnaire (S74), NCES used that to compute the student's age. Otherwise, the date of birth reported on School Record (R13) was used. MPR Associates grouped the students into three categories:

23 years old or

Student was 23 years old or younger as of 12/31/86.

younger

24 to 29 years old Student was between 24 and 29 years old as of 12/31/86.

30 years old or older Student was 30 years old or older as of 12/31/86.

## Student Socioeconomic Characteristics

## Student's earnings (NPSAS, MPR-derived)

MPR Associates grouped students into six categories based on the amount they reported earning from work, prior to withholdings, in 1986 (S87A):

No income

Student reported no earned income.

Less than \$11,000

Student reported total earnings of less than \$10,000.

\$11,000 to \$16,999

Student reported total earnings of between \$10,000 and \$16,999.

\$17,000 to \$22,999

Student reported total earnings of between \$17,000 and \$22,999 in 1986.

\$23,000 to \$29,999

Student reported total earnings of between \$23,000 and \$29,999 in 1986.

\$30,000 or more

Student reported total earnings of \$30,000 or more in 1986.

#### Family income status (NPSAS, S96)

Lt \$11,000	Student estimated parents' total annual income to be \$10,999 or less.
\$11,000-16,999	Student estimated parents' total annual income to be between \$11,000 and \$16,999.
\$17,000-22,999	student estimated parents' total annual income to be between \$17,000 and \$22,999.
\$23,000-29,999	Student estimated parents' total annual income to be between \$23,000 and \$29,999.
\$30,000-49,999	Student estimated parents' total annual income to be between \$30,000 and \$49,999.
\$50,000 plus	Student estimated parents' total annual income to be \$50,000 or more.

#### Dependency status (NPSAS, NCES-derived)

For students with financial aid records, NCES used dependency status as reported by the financial aid office on the Student Record (R25). For students who did not have financial aid records, NCES determined their dependency status based on information provided on the Student Questionnaire about how long they lived with their parents in 1985 and 1986 (S88A,B), whether their parents provided more than \$750 in support (S88C), and whether their parents claimed them as a tax exemption on their Federal income tax return (S88D).

Dependent	Student was considered financially dependent if, in 1985 or 1986, he/she lived with a parent for six or more weeks, received \$750 or more dollars from his/her parents, or was claimed as a tax exemption on their parents' Federal income tax return.
Independent	Student was considered financially independent if he/she did meet any of the conditions established for defining dependent students.

## Dependent student's family income (NPSAS, NCES- and MPR-derived)

For dependent students with financial aid records, NCES used parents' total income—IRS adjusted gross income plus total untaxed income—as reported by the financial aid office on the Student Record (R30E and R30L). For dependent students who did not have financial aid records but whose parents were included in the Parent Questionnaire, income was taken from the Parent Questionnaire (P24, P28A, and P28B). For all other dependent students, family income was imputed. MFR Associates grouped students into six categories:

Lt \$11,000	Family income was below \$11,000.
\$11,000-16,999	Family income was between \$11,000 and 16,999.
\$17,000-22,999	Family income was between \$17,000 and 22,999.
\$23,000-29,999	Family income was between \$23,000 and 29,999.

\$30,000-49,999

Family income was between \$30,000 and 49,999.

\$50,000 plus

Family income was \$50,000 or more.

# Independent student's income (NPSAS, NCES- and MPR-derived)

For independent students with financial aid records, NCES used student's and spouse's IRS adjusted gross income plus total untaxed income as reported by the financial aid office on the Student Record (R31D and R31J). For students without financial aid records, income was taken from the Student Questionnaire (S94A and S95). For independent students missing income information on the Student Questionnaire, income was imputed. MPR Associate students into six categories:

Lt \$11,000	Income for student and spouse was below \$11,000.
\$11,000-16,999	Income for student and spouse was between \$11,000 and \$16,999.
\$17,000-22,999	Income for student and spouse was between \$17,000 and \$22,999.
\$23,000-29,999	Income for student and spouse was between \$23,000 and \$29,999.
\$30,000-49,999	Income for student and spouse was between \$30,000 and \$49,999.
\$50,000 plus	Income for student and spouse was \$50,000 or more.

## Father's education (NPSAS, MPR-derived)

Students were asked to which of 12 education levels was the highest their father/male guardian completed (S99). MPR Associates created 6 categories to describe highest e. ucation level:

Less than HS	Father did not receive a high school diploma or equivalent.
High school only	Father received a high school diploma or equivalent but did not enroll in any form of postsecondary education.
Voc tech/lt 2yrs pse	Father's highest level of education was either a vocational certificate or license or less than two years of postsecondary education.
AA/gt 2yrs pse	Father's highest level of education was two or more year, of college (including a 2-year degree, but not a 4- or 5-year degree).
BA or BS	Father's highest level of education was a 4- or 5-year degree.
Advanced degree	Father's highest level of education was a graduate or professional degree (e.g., a Master's degree, PhD, MD, LLB.)

# Father's occupation (NPSAS, NCES- and MPR-derived)

NCES coded father's occupation based on the student's description of the pa ent's kind of job or occupation on the Student Questionnaire (S97). All information was coded using the

Department of Labor's standard occupational classification (SOC) scheme. MPR Associates grouped the occupations into the following categories:

Managerial Administrative, executive, and managerial occupations.

Professional Engineers, surveyors, architects, natural scientists, mathematicians,

computer scientists, social scientists, urban planners, social workers, recreation workers, religious workers, lawyers, judges, teachers (all levels), vocational and education counselors, librarians, archivists, curators, physicians, dentists, veterinarian, registered nurses, other health

diagnosing professions, writers, artists, entertainers, and athletes.

Marketing/sales All marketing and sales occupations.

Technical/support Health, engineering, and science technologists and technicians. Also

includes administrative support occupations, including clerical.

Services Service occupations.

Crafts Precision production and construction and extractive occupations, as well

as mechanics and repairers.

Manufacturing Handlers, equipment cleaners, helpers, laborers, motor vehicle operators,

and transportation and material moving occupations.

Agriculture Agricultural, forestry, and fishing occupation 3.

Military Military.

Homemaker Homemaker.

Other/unknown Miscellane au occupations plus not in labor force, retired, unemployed,

disabled. In therwise not classifiable.

#### Student Educational Characteristics

Attendance status (NPSAS, R22)

Full-time Student was enrolled full-time according to the institution's definition of

full-time enrollment.

Part-time Student was enrolled part-time according to the institution's definition of

part-time enrollment.

Educational objective (NPSAS, S4)

Certificate or award Student indicated that his/her fall courses were leading to a certificate or

award.

Associate's degree Student indicated that his/her fall courses were leading to a 2-year degree.

Bachelor's degree Students indicated that their fall courses were leading to a 4-year degree.

Student indicated that his/her fall courses were not leading to a degree, No formal award

certificate, or other formal award.

Undecided Student was undecided

## Enrollment level (NPSAS, MPR-derived)

Students reported their level in school in fall 1986 (S3). MPR Associates combined fourthand fifth-year undergraduates into one category.

First year Student's level was freshman or first year.

Second year Student's level was sophomore or second year.

Third year Student's level was junior or third year.

Fourth year or more Student's level was senior or fourth year or fifth year or more,

undergraduate.

## Employment status (NPSAS, MPR-derived)

Based on information reported on the Student Questionnaire (S17, S18, S20, and S22) on whether or not the student worked and whether or not he/she was a teaching or research assistant, MPR Associates grouped students into three categories:

Student reported working forty or more hours at one or more jobs (other Working full-time

than as a research or teaching assistant) in fall 1986.

Working part-time Student reported working less than forty hours at one or more jobs, (other

than as a research or teaching assistant) in fall 1986.

Not employed Student did not report work at any job (other than as a research or

teaching assistant) in fall 1986.

### Institutional Characteristics

## Institution level (NPSAS, R-VTYPE)

Less-than-2-year Institution where all of the programs are less than two years long. The

institution must offer a minimum of one program of at least three months in duration that results in a terminal certificate or award or is creditable

toward a formal 2-year or higher award.

2-year Institution that confers at least a 2-year formal award (certificate or

associate degree) or offers a two-year program that partially fulfills requirements for a baccalaureate or higher degree at a four-year institution.

The institution cannot award a baccaiaureate degree.

4-year not PhD granting

Institution that confers at least a baccalaureate degree, but cannot award

higher than a master's degree.

4-year PhD

Institution that confers at least a doctoral or first professional degree in

one or more programs.

Institution control (NPSAS, R-VCRTL)

Institution supported primarily through public funds and operated by Public

publicly elected or appointed officials.

Private, not-for-profit Institution privately operated and controlled. Primarily supported by

revenues from sources other than municipal, state, or federal

governments.

Institution privately operated and controlled, with profits that are subject Private, for-profit

to taxation.

Type of institution (NPSAS, R-VTYPE and VCRTL)

Public 4-year institution offering doctoral degrees. Public 4-yr PhD

Private not-for-profit 4-year institution offering doctoral degrees. Private-np 4-yr PhD

Public 4-year institution not offering doctoral degrees. Public 4-yr no PhD

Priv-np 4-yr no PhD Private not-for-profit 4-year institution offering doctoral degrees.

Public 2- to 3-year institution. Public 2-yr

Private not-for-profit 2- to 3-year or less than 2-year institution. Private-np lt 4-yr

Private for-profit 2- to 3-year or less than 2-year institution. Private-fp lt 4-yr

Public less-than-2-year institution. Public lt 2-yr

Geographic region (NPSAS, R-RLOCALST)

Institution located in Maine, New Hampshire, Vermont, Massachusetts, Northeast

Rhode Island, Connecticut, New York, New Jersey, or Pennsylvania

Institution located in Ohio, Indiana, Illinois, Michigan, Wisconsin, Minnesota, Iowa, Missouri, North Dakota, South Dakota, Nebraska, or Midwest

Kansas

Institution located in Delaware, Maryland, District of Columbia, Virginia, South

West Virginia, North Carolina, South Carolina, Georgia, Florida,

Kentucky, Tennessee, Alabama, Mississippi, Arkansas, Louisiana,

Oklahoma, or Texas.

West

Institution located in Montana, Idaho, Wyoming, Colorado, New Mexico, Arizona, Utah, Nevada, Washington, California, Alaska, or Hawaii.

# COLUMN VARIABLES THAT DO NOT APPYAR AS ROW VARIABLES

## Chapter III. Demographic and Socioeconomic Characteristics

Marital status (NPSAS, NCES- and MPR-derived)

On the Student Questionnaire (S78), students reported whether they were single, never married; married; separated; divorced; or widowed. Using these responses, NCES categorized students as married, separated, or not married. If marital status was missing and the student had a financial aid record, the Student Record (R24) was used to determine if the student was married, separated, or unmarried. MPR Associates combined the not married categories into one and labeled it "single."

Single

Marital status was single, divorced, widowed, or separated.

Married

Marital status was married.

## Dependent children (NPSAS, MPR-derived)

Using the number of children reported on the Student Questionnaire (S79), MPR Associates determined whether the student had one, two or more, or no dependent children.

No dep. children

Student reported having no dependent children.

One dependent child

Student reported having one dependent child.

Two+ dep. children

Student reported having two or more dependent children.

## Citizenship status (NPSAS, R15)

Citizan

Student was a U.S. civizen.

Resident alien

Student was a non-U.S. citizen who had been granted permanent

residence in the U.S.

Non-resident alien

Student was a non-U.S. citizen who had been granted temporary

residence in the U.S. (e.g. on a student visa).

## Veteran status (NPSAS, S81)

Veteran

Student was a veteran of the U.S. Armed Forces.

Not a veteran

Student was not a veteran of the U.S. Armed Forces.

## Chapter IV. Academic Preparation

High school diploma status (NPSAS, NCES-derived)

Where possible, the ype of high school diploma a student received was determined from the Student Questionnaire (S83A). Where this information was missing, the type was determined from the School Record (R9) if possible.

High school diploma Student received a high school diploma.

Certificate of completion

Student received a certificate of completion (high school equivalency certificate).

GED

Student received a General Equivalency Diploma.

Did not complete

Student did not receive a high school diploma or some equivalent.

High school course-taking patterns (HS&B, NCES-derived)

Students were classified as concentrators, limited concentrators, or limited participants in an academic area based on the number and types of courses they took. <sup>1</sup>

**Mathematics** 

Concentrators earned four or more credits in mathematics, at least one of which was from such advanced courses as analytic geometry, pure mathematics, solid geometry, analysis, calculus, mathematics 3, or statistics and probability. Four-Year College Bound earned four or more credits in mathematics, one of which was earned in algebra 1, 2, or 3; geometry; plane or solid geometry; trigonometry; or mathematics 1 or 2. General math earned one to two credits in math with less than two in college preparatory courses. Limited or non-participants earned less than one credit in math. This variable was obtained from the High School Transcript File.

Science

Concentrators earned one or more credits in each of the following: biology, chemistry, and physics in addition to any credits earned in general science courses. Four-year college bound earned one or more credits in an advanced physical science or an advanced life science in addition to any credits earned in general life or physical sciences. General science earned one or more credits in general life science or general physical science and less than one credit in advanced science offerings. Limited or non-participants earned less than one credit in science. This variable was obtained from the High School Transcript File.

Fine arts

Concentrators earned more than three credits in fine arts. General participants earned one or more but less than three credits in fine arts. Limited or non-participants earned no credits in fine arts.

<sup>&</sup>lt;sup>1</sup>More information on these categories can be found in Phillip Kaufman, *High School and Postsecondary Course-Taking Patterns*, forthcoming Contractor Report, NCES.

Computer science

Only a small percentage of students earned any credits in computer science. Concentrators earned credits (any number) in consputer science.

Non-participants earned no credits.

Humanities

Concentrators earned two or more credits in humanities over and above four credits in English, two credits in foreign language, and three credits in social studies (the New Basics recommended by the National Commission on Excellence in Education for high school graduation). Limited concentrators exceeded the New Basics by one but less than two courses. Limited participants earned less than or equal to the New Basics.

Vocational

Concentrators earned four or more credits in a single vocational education program, or earned four or more credits each in multiple instructional programs (e.g. business, marketing). Limited concentrators earned four or more credits in vocational education but less than four in a single instructional program. Samplers earned from a fraction of a credit to four credits in vocational education. Non-participants earned no credits in vocational education. This variable was obtained from the High School Transcript File.

Students accepted by first, second, and third choices (NPSAS, S16)

1st choice

Student was accepted at first choice of institutions applied to.

2nd choice

Student was accepted at second choice of institutions applied to.

3rd choice

Student was accepted at third choice of institutions applied to.

## Chapter V. Enrollment Characteristics

Housing arrangement (NPSAS, NCES-derived)

For students who reported where they resided, NCES used the information from the Student Questionnaire (S10). Otherwise, the housing status reported on the Student Record (R17) was used.

Institution-owned dormitory).

Student lived in some type of institution owned housing (e.g. a

Off campus with parents

housing

Student lived at home with parents.

Off campus not with parents

Student lived off campus in non-institution owned housing but not with his/her parents.

#### Field of study (NPSAS, NCE3- and MPR-derived)

NCES coded majors reported on the Student Record (R21F) by two-digit Classification of Instructional Programs (CIP) code. For students whose majors were missing or uncodable on the Student Record, the information provided on the Student Questionnaire (S43 or S37) was coded if possible. To reduce the number of categories, MPR Associates recoded the majors by combining CIP codes as follows:

Agriculture Agribusiness and agricultural production, agricultural sciences, renewable

natural resources.

Business/marketing Business and management, business (administrative support), marketing

and distribution; legal assisting.

Health Allied health; health sciences and nursing.

Occup. home ec. Consumer, personal, and miscellaneous services; home economics,

vocational home economics.

Trades and industry Construction trades; mechanics and repairers, precision production;

transportation.

Tech. engineering Computer sciences, engineering, engineering and related technologies;

science technologies; architecture and environmental design.

Educ./public service Education, library and archival sciences; military sciences; parks and

recreation; protective services.

Communications Communications technologies; communications.

Letters & languages Foreign languages; letters.

Humanities Philosophy and religion; theology; area and ethnic studies.

Science and math Life sciences; mathematics; physical sciences.

Social science Psychology; public affairs; social sciences.

Fine arts Visual and performing arts.

General studies Liberal/general studies; basic skills.

Remediation during the first year of enrollment (NPSAS, S86A through E)

Any remedial Student indicated that he/she took one or more hours of remedial

instruction in any area.

Writing Student indicated that he/she took one or more hours of remedial

instruction to improve basic writing skills.

Reading Student indicated that he/she took one or more hours of remedial

instruction to improve basic reading skills.

115

Math

Student indicated that he/she took one or more hours of remedial

instruction to improve basic math skills.

Study skills

Student indicated that he/she took one or more hours of remedial

instruction to improve study skills.

Other

Student indicated that he/she took one or more hours of remedial

instruction in an area not listed above.

## Chapter VI. Overview of Sources of Support

Contribution from self or spouse (NPSAS, NCES-derived)

A student was considered to have a made a contribution if either he/she (S54) or his/her spouse (S55) contributed towards paying school-related expenses.

Contribution from parents, other relatives, or friends (NPSAS, NCES-derived)

The parent contribution variable indicates whether or not the student received any support from his/her parents, other relatives, or friends to meet school-related expenses. In constructing this variable, several types of support were considered: direct contributions from parents/guardians (S56); automobile costs, room and board, transportation, the use of charge cards, and other forms of indirect support from parents (S58); loans from parents (S59); contributions from other relatives or friends (S60); and loans from other relatives or friends (S61). If any of these variables had a non-zero value, then the student was considered to have received parental contributions.

Received any financial aid (NPSAS, NCES-derived)

Two variables were used to describe the receipt of student financial aid. The first variable, ANY\_AID, indicates whether or not the student received aid, while the second variable, AID AMT, gives the amount of financial aid received. The two variables rely primarily on Student Record data (R35A1 through R35D8), using Student Questionnaire data to substitute for missing record information when necessary (S63, S18, S19, S49, S50, S66, S65, and S64).

Received federal financial aid (NPSAS, NCES-derived)

Several sources of data were used to determine whether students received federal financial aid (FED\_AID). First, the following variables were added together to determine the amount of federal aid awarded: R35A1 through R35A16D, R35B2, and R35B3A through R35B3E. Student Questionnaire information was substituted (S65A1, S65B1, S65B2, S65C2A, S65C4, and S65C5 (if S65C\_cd = 19)) when School Record information was missing or incomplete. If the sum of these variables was a non-zero value, then the student was considered to have

A-12

Received financial aid grants (NPSAS, NCES-derived)

The two variables GRAN AID and GRAN AMT were developed in the same madescribed for the variables that indicate receipt of any aid. The following student record variables were used to determine grant aid: R35A1, R35A2, R35A8, R35A10, R35A12A, R35A12B, R35A13A, R35A13B, R35A13D, R35A14A, R35A14B, R35A15A R35A15B, R35A16A, R35A16B, R35B1 through R35B4, R35B7A, R35C1, R35C2, R35C5, R35C11A, and R35D1 through R35D8. In cases where School Record information was missing, Student Questionnaire information was used (S65A1 through S65A4, S65C2 through S65C4, and S65ATOTL).

Received financial aid loans (NPSAS, NCES-derived)

The two variables LOAN AID and LOAN AMT were developed in the same manner described for the variables that indicate receipt of any aid. The following Student Record variables were used to determine loan aid: R35A3, R35A5, R35A6, R35A7, R35A9A, R35A9B, R35A9C, R35A11, R35A12DB, R35A13E, R35A14D, R35A15D, R35A16D, R35B6, R35B7B, R35C7, R35C8, and R35C11B. In cases where Student Record information was missing. Student Questionnaire information was used (S65B1 through S65B51, and S65BTUTL).

## Chapter VII. Educational Objectives and College Choice

Importance of factors in postsecondary choice (NPSAS, MPR-derived)

Students were given a list of 13 factors that might have affected their choice of postsecondary institution and asked to indicate whether the factor was very important, somewhat important, or not important (S13). Parents were given the same list of 13 factors and asked to indicate which were factors in the student's decision (P40). From this list of 13 factors, MPR Associates developed five categories:

Institution reputation Student indicated that institution reputation was very important in the decision to enter the institution attended in fall 1986.

Parent indicated that institution reputation was a factor.

Academic program

Student indicated that the fact that the institution offered the course of study the student wanted or that the institution had a good reputation for placing its graduates was very important.

Parent indicated that the fact that the institution offered the course of study the student wanted or that the institution had a good reputation for placing its graduates was a factor.

Finances

Student indicated that one or more of the following factors was very important: 1) he/she had a better chance to get a job at the institution, 2) tuition and other direct school expenses were less at the institution than at other institutions, 3) living costs at the institution were less than at other institutions, 4) he/she could work while attending school, or 5) he/she obtained the financial aid needed.

Parent indicated that one or more of the following were factors: 1) the student had a better chance to get a job at the institution, 2) tuition and other direct school expenses were less at the institution than at other institutions, or 3) living costs at the institution were less than at other institutions, 4) the student could work while attending school, or 5) that the student obtained the financial aid needed.

Location

Student indicated that the fact that the institution we the institution was far away from home, or that the home was very important.

Parent indicated that the fact that the institution was close to home, that the institution was far away from home, or that the student could live at home was a factor.

Personal

Student indicated that the fact that his/her parents/guardians wanted him/her to attend the institution or that his/her friends attended the institution was very important.

Parent indicated that the fact that the he/she or his/her spouse wanted the student to attend the institution or that the student's friends attended the institution was a factor.

#### APPENDIX B

## TECHNICAL NOTES AND METHODOLOGY

### The 1986-87 NPSAS Survey

The need for a nationally representative data base on postsecondary student financial aid prompted the U.S. Department of Education to conduct the 1986-87 National Postsecondary Student Aid Study (NPSAS). To meet these data needs the NPSAS sample as designed to include students enrolled in all types of postsecondary education. Thus, it included students enrolled in public institutions, private, nonprofit institutions, and private, for-profit institutions. The sample included students at 4-year and 2-year institutions, as well as students enrolled in occupationally specific programs that lasted for less than two years.

The original sample for the 1986-87 NPSAS data collection consisted of 1,353 postsecondary institutions stratified according to the highest course offering level (i.e., 4-year Ph.D.-granting, 4-year non-Ph.D.-granting, 2-year, or less-than-2-year) and institutional control (i.e., public, private nonprofit, or private for-profit). The final institutional cample was reduced to 1,074 after some institutions were found to be ineligible and others refused to participate. The institutional response rate, weighted by the probability of selection and enrollment, was about 95 percent.

A stratified sample of close to 60,000 students was then drawn from the October 1986 records of the institutions in the institutional sample. For each student in the sample, effons were made to collect registration and financial aid records from the institution. All student record information collected in the fall semester was later updated during the spring of 1987. This information was supplemented by mail and telephone survey information collected directly from students during the Spring of 1987. In to 1, the 1986-87 NPSAS record and student questionnaire file contains information on 43,176 students (34,544 undergraduates and 8,632 other). The overall response rate for students was 67 percent.

A Parent Questionnaire was mailed to the parents or guardians of a subsample of students chosen for participation in the 1986-87 NPSAS data collection. The purpose of this survey was to obtain detailed information on the family and economic characteristics of dependent students who did not receive financial aid. In keeping with this purpose, parents of financially independent students who were over 25 years of age were omitted from the sample. The overall response rate for this questionnaire was about 58 percent.

Readers should note that the NPSAS survey is not representative of all students enrolled during the 1986-87 academic year. Rather the survey sample represents all postsecondary students enrolled on October 15, 1986.

For more information on the NPSAS survey, consult National Postsecondary Student Aid Study Updated Record and Student Questionnaire (1987) Data File User's Manual (Longitudinal Studies Branch, Postsecondary Education Statistics Division, Washington, D.C.: National Center for Education Statistics, U.S. Department of Education, March 1989) and the National Postsecondary Student Aid Study Parent Survey Supplement Data File, Data File User's Manual (Westat, Inc., Washington, D.C., a contractor report prepared for the National Center for Education Statistics, U.S. Department of Education, August, 1988). More information on the estimates presented from other data sets (e.g. High School and Beyond) can be obtained by consulting the reference cited on the table.

Unless otherwise indicated, the estimates from the National Postsecondary Student Aid Study, 1987 (NPSAS-87) were based on the entire sample of students who were undergraduates in the fall of 1986. With the exception of Table VII.3, all estimates from the NPSAS-87 data file were calculated using the student weigh. (VST\_FWGT). For Table VII.3, the final five columns report the responses from parents taken from the NPSAS-87 parents file. Accordingly, these estimates were calculated using the parent weight, VPAR\_WGT.

Based on the level of coursework offered (i.e., 4-year Ph.D.-granting, 4-year non-Ph.D.-granting, 2-year, or less-than-2-year) and type of institutional control (i.e., public, private nonprofit, or private for-profit), postsecondary institutions can be divided into twelve groups. Cince the proportional enrollments in certain types of institutions were quite small, some categories were collapsed while others were omitted. In total eight institutional types are used in this tabulation: 1) public 4-year Ph.D.-granting, 2) public 4-year non-Ph.D.-granting, 3) public 2- to 3-year, 4) public less-than-2-year, 5) private nonprofit 4-year Ph.D.-granting, 6) private nonprofit 4-year non-Ph.D.-granting, 7) private nonprofit less-than-4-year (incorporating 2-year and less than 2-year), and 8) private, for-profit less-than-4-year (incorporating 2-year and less-than-2-year). Private, for-profit 4-year institutions (Ph.D.- granting and non-Ph.D.-granting), which account for less than 1 percent of total undergraduate enrollment, were omitted from the estimates for different types of institutions.

Tables C.V.1 through C.V.4 in Appendix C show the enrollment characteristics of students enrolled in each of the eight institution types described above. Thus, the percentages presented in these tables are based only on undergraduates enrolled from the type of institutions listed in the appropriate column header. For example, the percentage of students who were full- or part-time shown in Table . '.1 in columns one and two are based only on students enrolled at private, nonprofit 4-year F...D.-granting institutions.

\*

Tables C.V.5 through C.V.7 are based on subsamples of undergraduates chosen according to the type of postsecondary degree the students stated they were working toward at the time of the survey. Table C.V.5 only includes students who indicated that their degree objective was a postsecondary certificate. Similarly, Tables C.V.6 and C.V.7 show the major concentrations for students pursuing associate and bachelor's degrees, respectively.

Data on the proportions of students with various sources of support and the average aid awards shown in Tables C.VI.1 through C.VI.18 are based on the student population indicated in the table titles. These tables also provide separate estimates for students who were financially dependent and independent. The information presented on sources of support for undergraduates is based on financial aid composites developed by the National Center for Education Statistics.

## Accuracy of Estimates

The statistics in this report are estimates derived from a sample. Two broad categories of error occur in such estimates: sampling and nonsampling errors. Sampling errors happen because observations are made only on samples of students, not on entire populations. Nonsampling errors happen not only in sample surveys but also in complete censuses of entire populations.

Nonsampling errors can be attributed to a number of sources. inability to obtain complete information about all students in all institutions in the sample (some students or institutions refused to participate, or students participated but answered only certain items); ambiguous definitions; differences in interpreting questions; inability or unwillingness to give correct information; mistakes in recording or coding data, and other errors of collecting, processing, sampling, and estimating missing data.

B-2

The accuracy of a survey result is determined by the effect of sampling and nonsampling errors. In surveys with sample sizes as large as those in the NPSAS-87 study, sampling errors generally are not the primary concern, except where separate estimates are made for relatively small subpopulations such as Asian-Americans or Native Americans. In this report, small sample sizes were not usually a problem. Table B-1 shows the weighted totals for each of the row variables.

#### Statistical Procedures

The descriptive comparisons in this report were based on Student's t statistics. Comparisons based on the estimates of the proportions includes the estimates of the probability of a Type I error, or significance level. The significance levels were determined by calculating the Student's t values for the differences between each pair of means or proportions and comparing these to published tables of significance levels for two-tailed hypothesis testing.

The 1936-87 NPSAS survey, while representative and statistically accurate, was no. a simple random sample. Instead, the survey sample was selected using a more complex three step procedure with stratified samples and differential probabilities of selection at each leve. First, postsecondary institutions were initially selected within geographical strata. Once institutions were organized by zip code and state, they were further stratified by control (i.e., public, private, nonprofit, or private, for-profit) and offering (less-than-2-year, 2-year, 4-year non-Ph.D.-granting, and 4-year Ph.D.-granting). Sampling rates for students enrolled at different institutions and levels (undergraduate or other) varied, resulting in better data for policy purposes, but at a cost to statistical efficiency.

Simple random sample techniques for the estimation of standard errors frequently underestimate the true standard errors for some estimates. A measure of the magnitude of this underestimation of the true standard errors is the design effect. The design effect is the ratio of the actual variance of the estimate to the variance of the estimate calculated under simple random sample assumptions. When examining standard errors of estimates (the square roots of variances) the square root of the design effect is used. Table B.2 lists the square roots of several design effects (DEFTs) associated with NPSAS data.

Table B.2 -- Selected design effects (square roots) from NPSAS

Institutional characteristic	DEFT
All	2.05
Public	1.69
Private, not-for-profit	2.78
Private, for-profit	3.73
Less than 2-year	1.79
2-year	1.09
Other 4-year	1.09
Doctoral	0.85

<sup>&</sup>lt;sup>1</sup>See Leslie Kish, Survey Sampling, (New York, NY: John Wiley and Sons, 1965,

As an example, suppose one wishes to estimate the number of all postsecondary undergraduates who obtained federal aid in the Fall semester. As shown in Table B.2, the square root of the design effect for the variance of this statistic is 2.05. Therefore, standard errors calculated with simple andom sample techniques will underestimate true standard errors by a magnitude of about two. Statistical tests using standard errors calculated by simple random sampling techniques will therefore be too liberal. To overcome this problem, standard errors for all estimates in this tabulation were calculated using Taylor residual techniques. All estimates, standard errors, unweighted n's and weighted n's are available from the Longitudinal Studies Branch in comma-separated form for use with all major spreadsheet software and microcomputers. Standard errors for a few selected variables are shown in Table B-3.

Student's t values may be computed for comparisons using these tables' estimates with the following formula:

$$t = P_1 - P_2 / SQRT (se_1^2 + se_2^2)$$

where  $P_1$  and  $P_2$  are the estimates to be compared and se<sub>1</sub> and se<sub>2</sub> are their corresponding standard errors.

There are hazards in reporting statistical tests for each comparison. First, the test may make comparisons based on large t statistics appear to merit special attention. This can be misleading, since the magnitude of the t statistic is related not only to the observed differences in means or percentages but also to the number of students in the specific categories used for comparison. Hence, a small difference compared across a large number of students would produce a large t statistic.

A second hazard in reporting statistical tests for each comparison is that, when making multiple comparisons among categories of an independent variable, for example, different levels of income, the probability of a Type I error for these comparisons taken as a group is larger than the probability for a single comparison. When more than one difference between groups of related characteristics or "families" are tested for statistical significance, we must apply a standard that assures a level of significance for all of those comparisons taken together.

<sup>&</sup>lt;sup>1</sup>For information on the Taylor Series method, see, for example, Eun Sui Lee, Ronald N. Forthofer, and Ronald J. Lorimor, Analyzing Complex Survey Data. (Newbury Park, Ca: Sage Publications, 1989).

Comparisons were made in this report only when  $p \le .05 / k$  for a particular pairwise comparison, where that comparison was one of k tests within a family. This guarantees both that the individual comparison would have  $p \le .05$  and that when k comparisons were made within a family of possible tests, the significance level of the comparisons would sum to  $p \le .05$ .

For example, in a comparison of enrollment for males and females, only one comparison is possible (males v. females). In this family, k = 1, and the comparison can be evaluated with a **Student's** t test. When students are divided into three racial/ethnic groups and all possible comparisons are made, then k = 3 and the significance level of each test m ast be  $p \le .05/3$ , or .0167. In this report, when comparisons are made between rates of delayed entry in three different types of postsecondary institutions, then k = 3 and the significance level of each test must be  $p \le .05/3$ , or .0167, in order to be considered statistically significant.

The computer programs used to prepare these tabulations produced estimates for subgroups with 30 or more cases (automatically suppressing estimates based on 29 or fewer cases). For more information, contact Carl M. Schmitt, National Center for Education Statistics, Longitudinal Studies Branch, 555 New Jersey Avenue, NW, Washington. DC 20208-5652 (phone 202 356-6772).

This report has been prepared by MPR Associates, Inc. of Berkeley, Ca. for the Longitudinal Studies Branch, Postsecondary Education Statistics Division, National Center for Education Statistics, Office for Educational Research and Improvement, U.S. Department of Education under Contract No. RS88001001.

<sup>&</sup>lt;sup>1</sup> The standard that  $p \le .05/k$  for each comparison is more stringent than the criterion that the significance level of the comparisons should sum to  $p \le .05$ . For tables showing the t statistic required to insure that  $p \le .05/k$  for a particular family size and degrees of freedom, see Oliver Jean Dunn, "Multiple Comparisons Among Means," Journal of the American Statistical Association, 56: 52-64.
